Cuntz-Pimsner algebras

GPOTS 2011 1 / 21

A D M A A A M M

Let  $\mathcal{M}$  denote a  $C^*$ -algebra throughout.

### Definition

A (right) Hilbert  $C^*$ -module E over  $\mathcal{M}$  is a  $C^*$ -correspondence if it is also a *left*  $\mathcal{M}$ -module, with multiplication on the left given by adjointable operators.

That is: there exists a \*-homomorphism  $\varphi : \mathcal{M} \to \mathcal{L}(E)$  such that  $a \cdot \zeta$  is defined to be  $\varphi(a)\zeta$  for  $a \in \mathcal{M}$  and  $\zeta \in E$ .

### Examples

• 
$$\mathcal{M} = \mathbb{C}, E = \mathcal{H} \text{ and } \varphi(\alpha)\zeta := \alpha\zeta.$$

**2**  $E = {}_{\alpha}\mathcal{M}$  where  $\alpha$  is an endomorphism of  $\mathcal{M}$ ( $E = \mathcal{M}$  as sets and  $\varphi(a)\zeta := \alpha(a)\zeta$ ).

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# The Toeplitz algebra

### Definition

Let *E* denote a  $C^*$ -correspondence over  $\mathcal{M}$ .

• The Fock space is the correspondence

$$\mathcal{F}_E := \bigoplus_{n \in \mathbb{Z}_+} E^{\otimes n} = \mathscr{M} \oplus E \oplus E^{\otimes 2} \oplus \dots$$

• For  $a \in \mathscr{M}$  and  $\zeta \in E$ , let  $\varphi_{\infty}(a), S(\zeta) \in \mathcal{L}(\mathcal{F}_E)$  be given by

$$\varphi_{\infty}(\mathbf{a}): \eta \mapsto \mathbf{a} \cdot \eta \qquad \mathbf{S}(\zeta): \eta \mapsto \zeta \otimes \eta$$

 $(\eta \in X(m), m \in \mathbb{Z}_+).$ It is a simple calculation that  $S(\xi)^*S(\zeta) = \varphi_{\infty}(\langle \xi, \zeta \rangle).$ 

The Toeplitz algebra *T*(E) is the C\*-subalgebra of *L*(*F*<sub>E</sub>) generated by the operators φ<sub>∞</sub>(·), S(·).

< ロ > < 同 > < 回 > < 回 >

### Definition (Pimsner, 1995)

Let *E* denote a *faithful*  $C^*$ -correspondence over  $\mathcal{M}$ .

• The ideal  $\mathcal{J} \trianglelefteq \mathscr{M}$  is defined by

$$\mathcal{J} := \varphi^{-1}\left(\mathcal{K}(E)\right).$$

• We have  $\mathcal{K}(\mathcal{F}_E\mathcal{J}) \trianglelefteq \mathcal{T}(E)$ . More precisely,

$$\mathcal{T}(E) \cap \mathcal{K}(\mathcal{F}_E) = \mathcal{K}(\mathcal{F}_E\mathcal{J}).$$

• The Cuntz-Pimsner algebra is

$$O(E) := \mathcal{T}(E)/\mathcal{K}(\mathcal{F}_E\mathcal{J}).$$

# Universal property (1) + examples

Embed 
$$\mathcal{K}(E) \hookrightarrow \mathcal{T}(E)$$
 by  $\Psi : \zeta \otimes \eta^* \mapsto \mathcal{S}(\zeta)\mathcal{S}(\eta)^*$ .

#### Theorem (Pimsner, 1995)

A C<sup>\*</sup>-representation  $\pi$  of  $\mathcal{T}(E)$  factors through  $O(E) \Leftrightarrow$  for all  $a \in \mathcal{J}$  we have  $\pi(\Psi(\varphi(a))) = \pi(\varphi_{\infty}(a))$ .

### Examples

- $\mathcal{M} = E = \mathbb{C} \rightsquigarrow \mathcal{T}(E)$  is the (classical) Toeplitz algebra,  $O(E) = C(\mathbb{T}).$
- G is a finite graph of d vertices, E is the graph correspondence of G (with M = C<sup>d</sup>) → O(E) is the Cuntz-Krieger algebra of G.
- $\mathscr{M}$  is a unital  $C^*$ -algebra,  $\alpha \in \operatorname{Aut} \mathscr{M}$ ,  $E := {}_{\alpha} \mathscr{M} \rightsquigarrow O(E) \cong \mathscr{M} \rtimes_{\alpha} \mathbb{Z}$ .
- This could be generalized further to crossed products of Hilbert bimodules.

The Toeplitz algebra  $\mathcal{T}(E)$  has a gauge action: for  $\lambda \in \mathbb{T}$  there is  $\alpha_{\lambda} \in Aut(\mathcal{T}(E))$  with

$$\varphi_{\infty}(a) \mapsto \varphi_{\infty}(a) \qquad S(\zeta) \mapsto \lambda S(\zeta).$$

An ideal  $I \leq \mathcal{T}(E)$  is called *gauge invariant* if  $\alpha_{\lambda}(I) = I$  for all  $\lambda$ . Recall that  $O(E) = \mathcal{T}(E)/\mathcal{K}(\mathcal{F}_E \mathcal{J})$ .

The gauge-invariant uniqueness theorem (Katsura, 2007)

The ideal  $\mathcal{K}(\mathcal{F}_E \mathcal{J})$  is the <u>largest</u> among ideals  $\mathcal{I}$  of  $\mathcal{T}(E)$  s.t.:

I is gauge invariant.

イロト イ理ト イヨト イヨト

### Definition

A subproduct system is a family  $X = (X(n))_{n \in \mathbb{Z}_+}$  of *C*<sup>\*</sup>-correspondences over the *C*<sup>\*</sup>-algebra  $\mathcal{M} := X(0)$ , such that

 $X(n+m) \subseteq X(n) \otimes X(m),$ 

and moreover, X(n+m) is orthogonally complementable in  $X(n) \otimes X(m)$ , for all  $n, m \in \mathbb{Z}_+$ .

### Product systems - the "trivial" example

*E* is an (essential) *C*<sup>\*</sup>-correspondence over  $\mathcal{M}$  and  $X(n) = E^{\otimes n}$  for all  $n \in \mathbb{Z}_+$ .

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# Examples

### $SSP_d$ (the symmetric subproduct system), $d \in \mathbb{N}$

 $X(n) = (\mathbb{C}^d)^{\otimes n}$  (the *n*-fold symmetric tensor product of  $\mathbb{C}^d$ ) for all *n*.

 $SSP_{\infty}$  (the infinite-dimensional symmetric subproduct system)

 $X(n) = (\ell_2)^{(s)n}$ . Here dim X(n) is infinite for all  $n \in \mathbb{N}$ .

### $P \in M_d$ , $P_{ij} \ge 0$ for all i, j

X(n) is the "support" quiver of the matrix  $P^n$ .

### cp-semigroups

A subproduct system can be associated with any  $\mathit{cp}\text{-semigroup}$  over  $\mathbb{Z}_+.$ 

Ami Viselter (Technion, Israel)

・ロト ・ 四ト ・ ヨト ・ ヨト … ヨ

# The Toeplitz algebra for subproduct systems

Let  $X = (X(n))_{n \in \mathbb{Z}_+}$  be a subproduct system.

Definition (The X-Fock space and creation operators (X-shifts))

- Setting E := X(1), we have  $X(n) \subseteq E^{\otimes n}$ .
- Denote by  $p_n \in \mathcal{L}(E^{\otimes n})$  the orthogonal projection of  $E^{\otimes n}$  on X(n).
- Define  $\mathcal{F}_X := \bigoplus_{n \in \mathbb{Z}_+} X(n) = \mathscr{M} \oplus X(1) \oplus X(2) \oplus X(3) \oplus \ldots$
- For  $n \in \mathbb{Z}_+$  and  $\zeta \in X(n)$ , define  $S_n^X(\zeta) \in \mathcal{L}(\mathcal{F}_X)$  by

 $(\forall m \in \mathbb{Z}_+, \eta \in X(m))$   $S_n^X(\zeta)\eta := p_{n+m}(\zeta \otimes \eta) \in X(n+m)$ 

#### Definition

The *Toeplitz algebra*  $\mathcal{T}(X)$  of X is the C<sup>\*</sup>-subalgebra of  $\mathcal{L}(\mathcal{F}_X)$  generated by  $\{S_n^X(\zeta) : n \in \mathbb{Z}_+, \zeta \in X(n)\}$ .

イロト イ理ト イヨト イヨト

The definition of the Toeplitz algebra for subproduct systems is natural.

But how should one define the Cuntz-Pimsner algebra for subproduct systems?

We will present a possible "candidate", and try to "justify" it by demonstrating some of its virtues.

# The Cuntz-Pimsner algebra for subproduct systems

Assume henceforth that X(n) is faithful for all n.

Write  $Q_n \in \mathcal{L}(\mathcal{F}_X)$  for the projection on the direct summand X(n).

### Proposition

The set

$$I := \left\{ S \in \mathcal{T}(X) : \lim_{n \to \infty} \|SQ_n\| = 0 \right\}$$

is a gauge-invariant *ideal* of  $\mathcal{T}(X)$  (and in fact,  $\mathcal{I} = \langle \mathcal{I} \cap \mathcal{T}_0(X) \rangle$ , where  $\mathcal{T}_0(X)$  is the 0th spectral subset of  $\mathcal{T}(X)$  w.r.t. the gauge action).

Clearly  $\mathcal{K}(\mathcal{F}_X\mathcal{J}) \subseteq \mathcal{T}(X) \cap \mathcal{K}(\mathcal{F}_X) \subseteq I$ .

Definition (V.)

The Cuntz-Pimsner algebra of X is defined as  $O(X) := \mathcal{T}(X)/\mathcal{I}$ .

### Proposition

If X is a product system, then  $I = \mathcal{K}(\mathcal{F}_X \mathcal{J})$ . Thus, O(X) = O(E).

Ami Viselter (Technion, Israel)

- $X = SSP_d \rightsquigarrow I = \mathbb{K}$  and  $O(X) = C(\partial B_d)$  (Arveson's construction)
- Other More generally: *M* = C and *E* is a finite dimensional Hilbert space → *I* = K
- X = SSP<sub>∞</sub> → O(X) = C(B), where B is the closed unit ball of ℓ<sub>2</sub> with the Tychonoff topology (by the way: O<sub>∞</sub> =?) Question: is *I* simple in this case? (our guess: no)
- If  $Q_n \in \mathcal{T}(X)$  for all *n* then  $\mathcal{I} = \langle Q_n : n \in \mathbb{Z}_+ \rangle$ Example: the subproduct system of  $P \in M_d$  with  $P_{ij} \ge 0$  for all *i*, *j*

イロン イ理 とくほ とくほ とう

#### Example

The Toeplitz algebra of  $SSP_2$  does not admit a largest ideal which does not contain the unit *I*, and which is gauge invariant.

#### Sketch of proof.

Suppose that such ideal  $\mathcal{P} \trianglelefteq \mathcal{T}(SSP_2)$  exists.

 $\bigcirc \mathcal{P} \text{ is largest} \rightsquigarrow \mathbb{K} \subseteq \mathcal{P}$ 

$$0 \to \mathbb{K} \to \mathcal{T}(\mathrm{SSP}_2) \to C(\partial B_2)$$

**③**  $\mathcal{P}/\mathbb{K}$  has a clear structure as an ideal of  $C(\partial B_2)$ 

Now it is easy to find a larger ideal with the desired properties.

★ 글 ► ★ 글 ►

A D M A A A M M

- Consider the subspaces  $\mathcal{L}(\oplus_{k=0}^{n} X(k))$  of  $\mathcal{L}(\mathcal{F}_{X})$
- Let  $\mathcal{B}$  be the \*-algebra  $\bigcup_{n=0}^{\infty} \mathcal{L}(\oplus_{k=0}^{n} X(k))$
- $\mathcal{T}(X)$  is contained in the multiplier algebra  $M(\overline{\mathcal{B}})$
- Let  $q: M(\overline{\mathcal{B}}) \to M(\overline{\mathcal{B}})/\overline{\mathcal{B}}$  be the quotient map.

### Easy proposition

$$O(X) \cong q(\mathcal{T}(X))$$
. That is, ker  $q|_{\mathcal{T}(X)} = I$ .

The proposition generalizes a result of Pimsner (1995). In fact, this was the original definition of the Cuntz-Pimsner algebra.

A (1) > A (1) > A

### Definition

A C<sup>\*</sup>-representation  $\pi$  of  $\mathcal{T}(X)$  on  $\mathcal{H}$  is *essential* if for every *n*,

$$\overline{\operatorname{span}}\bigcup_{\zeta\in X(n)}\operatorname{Im}\pi\left(S_n(\zeta)\right)=\mathcal{H}.$$

#### Remark

If X is a *product* system, then  $\pi$  is essential  $\Leftrightarrow$  it is fully coisometric.

### Theorem (Hirshberg (2005), Skeide (2009))

Let E be a faithful and essential C\*-correspondence. Then

$$\bigcap_{\substack{\pi \text{ is an essential}\\ \text{representation of } \mathcal{T}(E)}} \ker \pi = \mathcal{K}(\mathcal{F}_{E}\mathcal{J}).$$

Ami Viselter (Technion, Israel)

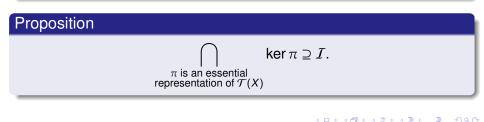

### Open question

Is it true that under (mild) hypotheses we have

$$\bigcap_{\pi \text{ is an essential}} \ker \pi = I \quad ?$$

representation of  $\mathcal{T}(X)$ 

We conjecture that it is. What if "essential" is replaced by "fully coisometric"?

The conjecture (in its strict version) is true in many interesting cases. For instance:

- "Finite dimensional" subproduct systems:
  - X(1) is a finite-dimensional Hilbert space (e.g.:  $X = SSP_d, d \in \mathbb{N}$ )
  - The subproduct system of  $P \in M_d$  with  $P_{ij} \ge 0$  for all i,j
- 2 But also  $SSP_{\infty}$ .

### Definition (Muhly and Solel (2000))

Let *E*, *F* be *C*<sup>\*</sup>-correspondences over  $\mathscr{A}$ ,  $\mathscr{B}$ . *E* is strongly Morita equivalent to *F* if  $\mathscr{A}$  is ME to  $\mathscr{B}$  via an equivalence bimodule M, and there exists an isomorphism  $W : M \otimes F \to E \otimes M$ . Notation:  $E \stackrel{\text{SME}}{\sim}_{M} F$ .

If  $E \stackrel{\text{SME}}{\sim}_{M} F$ , define isomorphisms  $W_n : M \otimes F^{\otimes n} \to E^{\otimes n} \otimes M$  by  $W_1 := W$  and  $W_n := (I_E \otimes W_{n-1})(W \otimes I_{F^{\otimes (n-1)}})$ .

### Definition (V.)

Subproduct systems *X*, *Y* are strongly Morita equivalent if  $X(1) \stackrel{\text{SME}}{\sim}_{M} Y(1)$  and

$$W_n(M \otimes Y(n)) = X(n) \otimes M$$

for all n.

ヘロト ヘ回ト ヘヨト ヘヨト

### Morita equivalence (cont.)

For a subproduct system X, the *tensor algebra*  $\mathcal{T}_+(X)$  is the operator subalgebra of  $\mathcal{T}(X)$  generated by all X-shifts.

The following generalizes a theorem of Muhly and Solel (2000) for *product systems*.

### Theorem (V.)

If X is strongly Morita equivalent to Y, then:

- $\mathcal{T}_+(X)$  is strongly Morita equivalent<sup>a</sup> to  $\mathcal{T}_+(Y)$
- **2**  $\mathcal{T}(X)$  is Morita equivalent to  $\mathcal{T}(Y)$
- So The Rieffel correspondence of  $\mathcal{T}(X) \sim \mathcal{T}(Y)$  carries I(X) to I(Y). Therefore O(X) is Morita equivalent to O(Y).

<sup>a</sup>as operator algebras, *a la* Blecher, Muhly and Paulsen (2000)

This is another evidence that our definition of the Cuntz-Pimsner algebra for subproduct systems is "natural".

Ami Viselter (Technion, Israel)

Cuntz-Pimsner algebras

# More open questions

- **(1)** Is there a "strong" universality characterization of O(X)?
- What is the ideal structure of O(X)?
  (The general case seems hopeless; what about specific families?)
- In the spirit of Cuntz (1977), Pimsner used an "extension of scalars" method to find a C\*-algebra that is naturally isomorphic to O(E), and for which there is a *semi-split* exact sequence with the Toeplitz algebra<sup>1</sup>.

Could this be done in our context?

Is there a relation between O(X) and  $C^*_{env}(\mathcal{T}_+(X))$ ? Different cases have very different answers:

$$C^*_{\mathrm{env}}(\mathcal{T}_+(E)) = O(E),$$

but

$$C^*_{\mathrm{env}}(\mathcal{T}_+(\mathrm{SSP}_d)) = \mathcal{T}(\mathrm{SSP}_d) \qquad (d \in \mathbb{N}).$$

We do not know what  $C^*_{env}(\mathcal{T}_+(\mathrm{SSP}_\infty))$  is.

<sup>1</sup>Pimsner used this to obtain a KK-theoretical six-term exact sequence.

# Thank you for listening!
